

# **Chapter 4: Intermediate SQL**

Database System Concepts, 6th Ed.

©Silberschatz, Korth and Sudarshan (Modified by Hyo-Sang Lim)

# **Chapter 4: Intermediate SQL**

- Join Expressions
- Views
- Transactions
- Integrity Constraints
- SQL Data Types and Schemas

#### **Joined Relations**

- Join operations take two relations and return as a result another relation.
- A join operation is a Cartesian product which requires that tuples in the two relations match (under some condition). It also specifies the attributes that are present in the result of the join.
- The join operations are typically used as subquery expressions in the from clause.

Database System Concepts - 6th Edition

# Join operations – Example

Relation course

course_id	title	dept_name	credits
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

Relation prereq

course_id	prereq_id
BIO-301	BIO-101
CS-190	CS-101
CS-347	CS-101

Note: prereq information missing for CS-315 and course information missing for CS-437.

#### **Outer Join**

- An extension of the join operation that avoids loss of information.
- Computes the join and then adds tuples form one relation that does not match tuples in the other relation to the result of the join.
- Uses null values.

Database System Concepts - 6th Edition

4.5

#### **Left Outer Join**

course natural left outer join prereq

course_id	title	dept_name	credits	prere_id
		Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
		Comp. Sci.	3	null

Note: read prere\_id as prereq\_id

# **Right Outer Join**

course natural right outer join prereq

course_id	title	dept_name	credits	prere_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-347	null	null	null	CS-101

Database System Concepts - 6th Edition

4.7

## **Full Outer Join**

course natural full outer join prereq

course_id	title	dept_name	credits	prere_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-315	Robotics	Comp. Sci.	3	null
CS-347	null	null	null	CS-101

#### **Joined Relations**

- Join operations take two relations and return as a result another relation.
- These additional operations are typically used as subquery expressions in the **from** clause
- **Join condition** defines which tuples in the two relations match, and what attributes are present in the result of the join.
- **Join type** defines how tuples in each relation that do not match any tuple in the other relation (based on the join condition) are treated.

Join types
inner join
left outer join
right outer join
full outer join

Join Conditions
natural
<b>on</b> < predicate>
<b>using</b> $(A_1, A_1,, A_n)$

Database System Concepts - 6th Edition

## Joined Relations – Examples

course inner join prereq on course.course\_id = prereq.course\_id

course_id	title	dept_name	credits	prere_id	course_id
BIO-301	Genetics	Biology	4	BIO-101	BIO-301
CS-190	Game Design	Comp. Sci.	4	CS-101	CS-190

course left outer join prereq on course.course\_id = prereq.course\_id

course_id	title	dept_name	credits	prere_id	course_id
BIO-301	Genetics	Biology	4	BIO-101	BIO-301
CS-190	Game Design	Comp. Sci.	4	CS-101	CS-190
CS-315	Robotics	Comp. Sci.	3	null	null

## Joined Relations – Examples

course natural right outer join prereq

course_id	title	dept_name	credits	prere_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-347	null	null	null	CS-101

course right outer join prereq using (course\_id)

course_id	title	dept_name	credits	prere_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-315	Robotics	Comp. Sci.	3	null
CS-347	null	null	null	CS-101

#### **Views**

- In some cases, it is not desirable for all users to see the entire logical model (that is, all the actual relations stored in the database.)
- Consider a person who needs to know an instructors name and department, but not the salary. This person should see a relation described, in SQL, by

**select** *ID*, *name*, *dept\_name* **from** *instructor* 

- A view provides a mechanism to hide certain data from the view of certain users.
- Any relation that is not of the conceptual model but is made visible to a user as a "virtual relation" is called a view.

#### **View Definition**

A view is defined using the create view statement which has the form

create view v as < query expression >

where <query expression> is any legal SQL expression. The view name is represented by *v*.

- Once a view is defined, the view name can be used to refer to the virtual relation that the view generates.
- View definition is not the same as creating a new relation by evaluating the query expression
  - Rather, a view definition causes the saving of an expression;
     the expression is substituted into queries using the view.

Database System Concepts - 6th Edition

4.13

©Silberschatz, Korth and Sudarshan

## **Example Views**

- A view of instructors without their salary
   create view faculty as
  - select ID, name, dept\_name
    from instructor
- Find all instructors in the Biology department select name from faculty

where dept\_name = 'Biology'

- Create a view of department salary totals
  - create view departments\_total\_salary(dept\_name, total\_salary) as
     select dept\_name, sum (salary)
     from instructor
     group by dept\_name;

## **Update of a View**

Add a new tuple to *faculty* view which we defined earlier

insert into faculty values ('30765', 'Green', 'Music');

This insertion must be represented by the insertion of the tuple ('30765', 'Green', 'Music', null)

into the instructor relation.

Database System Concepts - 6th Edition

#### **Transactions**

- Unit of work
- Atomic transaction
  - either fully executed or rolled back as if it never occurred
- Isolation from concurrent transactions
- Transactions begin implicitly
  - Ended by commit work or rollback work
- But default on most databases: each SQL statement commits automatically
  - Can turn off auto commit for a session (e.g. using API)
  - In SQL:1999, can use: begin atomic .... end

# **Integrity Constraints**

- Integrity constraints guard against accidental damage to the database, by ensuring that authorized changes to the database do not result in a loss of data consistency.
  - A checking account must have a balance greater than \$10,000.00.
  - A salary of a bank employee must be at least \$4.00 an hour.
  - A customer must have a (non-null) phone number.

Database System Concepts - 6th Edition

4.17

©Silberschatz, Korth and Sudarshan

# **Constraints on a Single Relation**

- not null
- primary key
- unique
- check (P), where P is a predicate

## **Not Null and Unique Constraints**

#### not null

- Declare name and budget to be not null name varchar(20) not null budget numeric(12,2) not null
- **unique**  $(A_1, A_2, ..., A_m)$ 
  - The unique specification states that the attributes A1, A2, ... Am form a candidate key.
  - Candidate keys are permitted to be null (in contrast to primary keys).

Database System Concepts - 6th Edition

4.19

©Silberschatz, Korth and Sudarshan

#### The check clause

■ check (P)

where P is a predicate

Example: ensure that semester is one of fall, winter, spring or summer:

```
create table section (
    course_id varchar (8),
    sec_id varchar (8),
    semester varchar (6),
    year numeric (4,0),
    building varchar (15),
    room_number varchar (7),
    time slot id varchar (4),
    primary key (course_id, sec_id, semester, year),
    check (semester in ('Fall', 'Winter', 'Spring', 'Summer'))
);
```

## **Referential Integrity**

- Ensures that a value that appears in one relation for a given set of attributes also appears for a certain set of attributes in another relation.
  - Example: If "Biology" is a department name appearing in one of the tuples in the *instructor* relation, then there exists a tuple in the *department* relation for "Biology".
- Let A be a set of attributes. Let R and S be two relations that contain attributes A and where A is the primary key of S. A is said to be a **foreign key** of R if for any values of A appearing in R these values also appear in S.

Database System Concepts - 6th Edition

4.21

©Silberschatz, Korth and Sudarshan

### **Cascading Actions in Referential Integrity**

```
    create table course (
        course_id char(5) primary key,
        title varchar(20),
        dept_name varchar(20) references department
      )
    create table course (
        ...
        dept_name varchar(20),
        foreign key (dept_name) references department
            on delete cascade
            on update cascade,
        ...
      )
```

alternative actions to cascade: set null, set default

#### **Other Features**

- create table student (ID varchar (5), name varchar (20) not null, dept\_name varchar (20), tot\_cred numeric (3,0) default 0, primary key (ID))
- create index studentID index on student(ID)
- Large objects
  - book review clob(10KB)
  - image blob(10MB)
  - movie blob(2GB)

Database System Concepts - 6th Edition

4.23

©Silberschatz, Korth and Sudarshan

## **Large-Object Types**

- Large objects (photos, videos, CAD files, etc.) are stored as a large object.
  - blob: binary large object -- object is a large collection of uninterpreted binary data (whose interpretation is left to an application outside of the database system)
  - clob: character large object -- object is a large collection of character data
  - When a query returns a large object, a pointer is returned rather than the large object itself.
